Nipple Drinking System

Installation and Operators Manual

Installation and Operators Manual

Installation and Operators Manual

Warranty

Chore-Time Poultry Production Systems, a division of CTB, Inc., (“Chore-Time”), warrants each new CHORE-TIME® product manufactured by it to be free from defects in material or workmanship for one (1) year from and after the date of initial installation by or for the original purchaser. If such a defect is found by Chore-Time to exist within the one-year period, the Chore-Time will, at its option, (a) repair or replace such product free of charge, F.O.B. the factory of manufacture, or (b) refund to the original purchaser the original purchase price, in lieu of such repair or replacement. Labor costs associated with the replacement or repair of the product are not covered by the Manufacturer.

Conditions and Limitations

1. The product must be installed by and operated in accordance with the instructions published by the **Manufacturer or Warranty will be void.**
2. Warranty is void if **all components** of the system are not original equipment supplied by the **Manufacturer.**
3. This product must be purchased from and installed by an authorized distributor or certified representative thereof or the Warranty will be void.
4. "Malfunctions or failure resulting from misuse, abuse, mismanagement, negligence, alteration, accident, or lack of proper maintenance, or from lightning strikes, electrical power surges or interruption of electricity shall not be considered defects under the Warranty. Corrosion, material deterioration and/or equipment malfunction caused by or consistent with excessive additions of chemicals, minerals, sediments or other foreign elements with the product shall not be considered defects under the Warranty."
5. This Warranty applies only to systems for the care of poultry and livestock. Other applications in industry or commerce are not covered by this Warranty.

Chore-Time shall not be liable for any **Consequential or Special Damage** which any purchaser may suffer or claim to suffer as a result of any defect in the product. **“Consequential” or “Special Damages” as used herein include, but are not limited to, lost or damaged products or goods, costs of transportation, lost sales, lost orders, lost income, increased overhead, labor and incidental costs and operational inefficiencies.**

THIS WARRANTY CONSTITUTES THE MANUFACTURER’S ENTIRE AND SOLE WARRANTY AND THIS MANUFACTURER DISCLAIMS ANY AND ALL OTHER WARRANTIES, INCLUDING, BUT NOT LIMITED TO, EXPRESS AND IMPLIED WARRANTIES AS TO MERCHANTABILITY, FITNESS FOR PARTICULAR PURPOSES SOLD AND DESCRIPTION OR QUALITY OF THE PRODUCT FURNISHED HEREUNDER.

Chore-Time Distributors are not authorized to modify or extend the terms and conditions of this Warranty in any manner or to offer or grant any other warranties for CHORE-TIME® products in addition to those terms expressly stated above. An officer of CTB, Inc. must authorize any exceptions to this Warranty in writing. Chore-Time reserves the right to change models and specifications at any time without notice or obligation to improve previous models.

Effective: **August 2008**

About This Manual

The intent of this manual is to help you in two ways. One is to follow step-by-step in the order of assembly of your product. The other way is for easy reference if you have questions in a particular area.

Important: Read ALL instructions carefully before starting construction.

Important: Pay particular attention to all SAFETY information.

- *Metric measurements are shown in millimeters and in brackets, unless otherwise specified. “ ” equals inches and “ ’ ” equals feet in English measurements.*

Examples:

1" [25.4]

4' [1 219]

- Optional equipment contains necessary instructions for assembly or operation.
- Very small numbers near an illustration (*i.e.*, 1257-48) are identification of the graphic, not a part number.

Note: The original, authoritative version of this manual is the English version produced by CTB, Inc. or any of its subsidiaries or divisions, (hereafter collectively referred to as "CTB"). Subsequent changes to any manual made by any third party have not been reviewed nor authenticated by CTB. Such changes may include, but are not limited to, translation into languages other than English, and additions to or deletions from the original content. CTB disclaims responsibility for any and all damages, injuries, warranty claims and/or any other claims associated with such changes, inasmuch as such changes result in content that is different from the authoritative CTB-published English version of the manual. For current product installation and operation information, please contact the customer service and/or technical service departments of the appropriate CTB subsidiary or division. Should you observe any questionable content in any manual, please notify CTB immediately in writing to: CTB Legal Department, P.O. Box 2000, Milford, IN 46542-2000 USA.

Safety Information

Caution, Warning and Danger Decals have been placed on the equipment to warn of potentially dangerous situations. Care should be taken to keep this information intact and easy to read at all times. Replace missing or damaged safety decals immediately.

Using the equipment for purposes other than specified in this manual may cause personal injury and/or damage to the equipment.

Safety–Alert Symbol

This is a safety–alert symbol. When you see this symbol on your equipment, be alert to the potential for personal injury. This equipment is designed to be installed and operated as safely as possible...however, hazards do exist.

Understanding Signal Words

Signal words are used in conjunction with the safety–alert symbol to identify the severity of the warning.

DANGER indicates an imminently hazardous situation which, if not avoided, **WILL** result in death or serious injury.

WARNING indicates a potentially hazardous situation which, if not avoided, **COULD** result in death or serious injury.

CAUTION indicates a hazardous situation which, if not avoided, **MAY** result in minor or moderate injury.

Safety Instructions

Follow Safety Instructions

Carefully read all safety messages in this manual and on your equipment safety signs. Follow recommended precautions and safe operating practices.

Keep safety signs in good condition. Replace missing or damaged safety signs.

Decal Descriptions

DANGER: Moving Auger

This decal is placed on the Panel Weldment.

Severe personal injury will result, if the electrical power is not disconnected, prior to servicing the equipment.

DANGER: Electrical Hazard

Disconnect electrical power before inspecting or servicing equipment unless maintenance instructions specifically state otherwise.

Ground all electrical equipment for safety.

All electrical wiring must be done by a qualified electrician in accordance with local and national electric codes.

Ground all non-current carrying metal parts to guard against electrical shock.

With the exception of motor overload protection, electrical disconnects and over current protection are not supplied with the equipment.

CAUTION:

Use caution when working with the Auger—springing Auger may cause personal injury.

General

Support Information

The Chore-Time Nipple Watering Systems are designed to provide water to poultry types. Using this equipment for any other purpose or in a way not within the operating recommendations specified in this manual will void the warranty and may cause personal injury.

This manual is designed to provide comprehensive planning and installation information. The Table of Contents provides a convenient overview of the information in this manual.

Tools for Installation

- | | |
|------------------------|-----------------------------------|
| 1 Regular Screwdriver | 6 Bolt Cutters or Hack Saw |
| 2 Locking Pliers | 7 PVC Cleaning Solvent |
| 3 File | 8 Electrical Drill and Drill Bits |
| 4 Saw to cut PVC Tubes | 9 Another Person to help |
| 5 Screw-Hook Driver | |

General Information

It is extremely important to maintain good water quality. Good water quality maximizes performance of the equipment, minimizes maintenance and repair, and increases the life of the system. The water should be free of foreign particles.

Pump the well prior to hookup of the system to clear sand, mud, or debris. CHORE-TIME recommends a water test by a reputable water treatment company in the area. Water treatment and/or extra filtration may be required, depending on the water test results.

CHORE-TIME recommends an incoming water pressure between 40 psi [276 kPa] minimum and 125 psi [862 kPa] maximum for use with the 9275, 36802-1 or 36802-2 control panel and 35308 step regulator. A pressure of 45 psi [310 kPa] is best. It is recommended to use the step regulator for regulating the water pressure through the control panel at 25psi [172 kPa] a maximum of 35 psi [241 kPa].

CHORE-TIME recommends a minimum incoming water pressure of 3 psi [21 kPa] for gravity feed systems. To obtain this minimum pressure the water level in the water tank should be maintained 8' [2.4 m] above the nipple line. CHORE-TIME recommends a Maximum line length of 250' [76 m] for a gravity feed system.

For every 28" [711 mm] drop in height, water pressure increases one pound. Measure the operating pressure at the water line height.

Incoming water supply should be at least a 1" [25 mm] diameter incoming line (preferably PVC) from a single well. If there are two or more supply wells, the supply line should be larger. Other factors such as, the distance from the well(s) to the filter control panel and other equipment which requires water could demand larger lines.

The suspension system must be correctly installed to insure proper operation of the system. This manual includes the suspension installation information.

The CHORE-TIME nipple drinker is available with nipples spaced 6" [150 mm], 8" [200 mm], 10" [250 mm], 12" [300 mm], 15" [380 mm], 20" [508 mm], or 24" [610 mm] on the 10' [3 m] pipe.

Water lines up to 500' [152 m] may be supplied using (1) regulator assembly. Water lines over 500' [152 m] must be split in the center of the house and supplied with (2) regulator assemblies. However the management of the lines over 250' [76 m] becomes more critical. They must be kept very level, flushed, and cleaned several times per flock.

The CHORE-TIME nipple drinker is available with the standard support channel for broiler applications. The Chore-Time nipple drinker is also available with the heavy support channel for pullets and breeders. **Figure 1** shows the difference between the standard and heavy support channel with the standard and button nipple assemblies in the STEADI-FLOW® drinkers. **Figure 2** shows the difference between the standard and heavy support channel and button nipple assemblies in the RELIA-FLOW® drinkers.

Figure 1. Various STEADI-FLOW® Drinker Styles

Figure 2. Various RELIA-FLOW® Drinker Styles

Manufacturer's Recommendations: Birds per Nipple

Type	Recommended Number birds per Nipple	Recommended Options
Broiler	30 for day old chicks 10-15 for grow-out	Standard channel-Standard Flow (Button options) or Standard channel-Hi Flow w/catch cup (Button options)
Breeder	8-10 for hot to warm climates 10-12 for warm to cool climates	Heavy Duty channel-standard-flow or Heavy Duty channel High Flow w/catch cup (Hot climates Only)
Pullets	16-24 for day-old chicks 8-12 for grow out	Standard channel-Standard Flow
Poult	10-15 after brooding	6 wks or less-Standard channel-Standard flow 7-9 wks-Heavy Duty channel (Hi Flow w/Buttons recommended)

For breeders, place the water line **INSIDE** The ULTRAFLO® Breeder Feeder Loop.

For a pan feeder system, place the water line within three feet [1m] of the feed line.

For pullets, it is ideal to place water lines on either side of the feed lines within 3 ft. [1m].

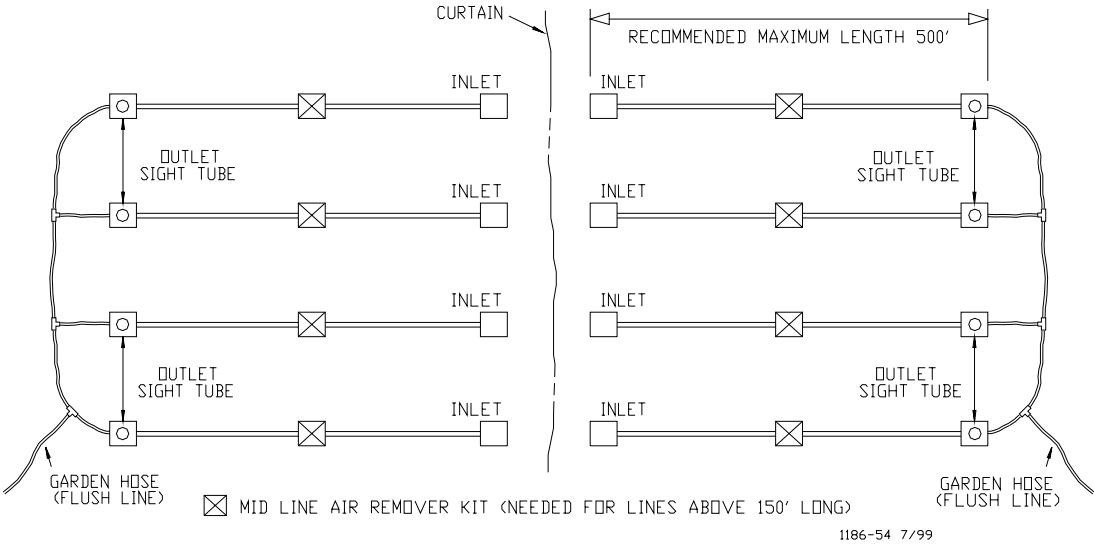

In areas where house temperature will reach 100°F (40°C) for sustained periods and no evaporative cooling or tunnel ventilation is used, an anti-roost system is needed.

Recommended incoming pressure of 30 to 35 psi [207 to 241 kPa].

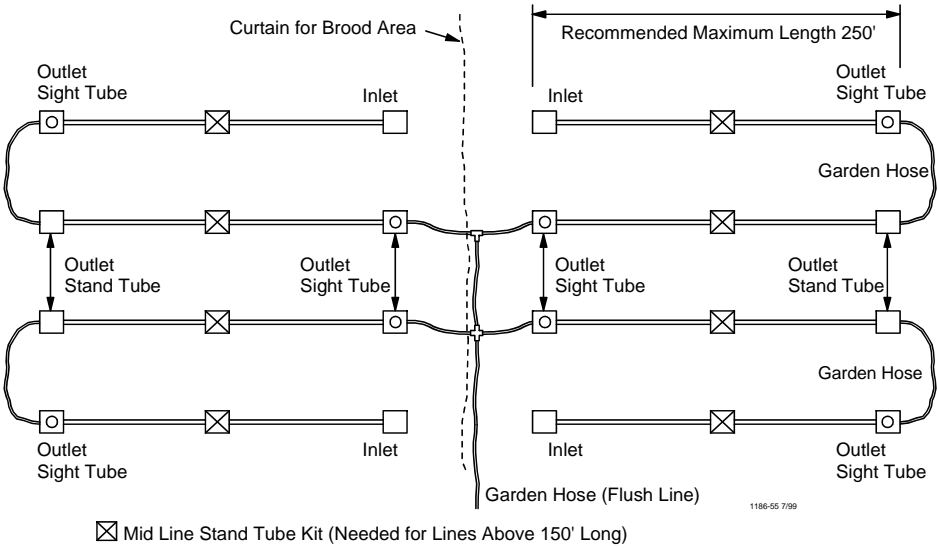

Planning the System layout

The diagrams below reflect approved system layouts. Use these diagrams as guidelines. Your system layout may be different.

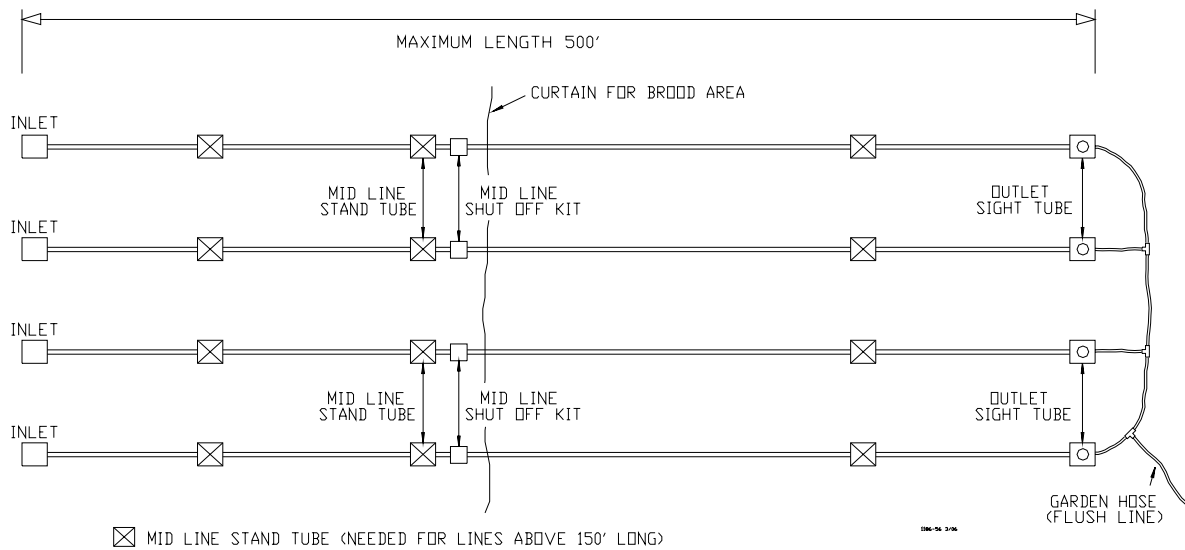

Preferred Layout

Alternate Layout #1

Alternate Layout #2

Suspension System Installation

The following installation instructions are for standard installations. For partial house brooding, the sections can be winched separately or together. Install each section as a separate section.

1. Determine where the water line is to be installed. Mark a straight line on the ceiling or rafters at this point using string or chalk line, or winch cable temporarily attached with staples or nails.
2. For installations using wood trusses, the standard screw hook or the optional ceiling hook may be used to hold the pulley assemblies.

For installations using steel trusses, the ceiling hooks are available to hold the pulley assemblies.

Screw hook installations: Install screw hooks along the line at 8' [2.4 m] or 10' [3 m] intervals.

Screw the threads all the way in to prevent bending. The opening of the hooks must point away from the direction the cable pulls. See **Figure 3**

Figure 3

Figure 3. Screw Hook Installation

Ceiling hook installations: Install ceiling hooks along the line at 8' [2.4 m] or 10' [3 m] intervals. If the ceiling hook is to be secured with bolts or self-tapping screws, install as shown in **Figure 4**. The ceiling hooks may be welded in place, if desired, instead of bolting.

Note: If the distance the water line is to be raised is greater than the distance between the pulleys, offset the pulleys from each other approximately 3" [75 mm].

Figure 4. Ceiling Hook Installation

3. After the screw hooks or ceiling hooks have been secured to the trusses install the pulley assemblies as shown in **Figures 3 & 4**. Make sure the screw hooks or ceiling hooks are pointing in the proper direction (opposite the winch).
4. Mount the split drum winch as shown in **Figure 6**. Mount the winch to the ceiling or on a 2 x 8" [50 x 200 mm] board spanning at least two rafters for support. Use at least (4) 1/4" lag screws (not supplied) to secure winch to support.

For systems less than 150' [46 m], the manual winch may be used in place of the split drum winch.

Figure 5. Offset the Screw/Ceiling Hooks

5. Bolt the winch to the bracket, as shown in **Figure 6**.

Figure 6. Winch Mounting

6. Attach one end of the 3/16" [4.8 mm] cable to the winch as shown in **Figure 7**. Unroll the cable along the length of the water line.

Figure 7. Cable Wrap on Drum

7. Cut a section of the 3/32" [2.3 mm] cable or cord for each suspension drop. The cable or cord should be approximately three feet [91 cm] longer than the distance from the floor to the ceiling so that it can be attached at the top and bottom.
Route the cable or cord around the swivel pulley and attach to the main cable, using a clamp.
8. Cable drop installations: Install an adjustment leveler on each drop line. See **Figure 8**.
Cord drop installations: Install a cord adjuster on each drop line. See **Figure 8**.

Figure 8. Cable Drop Installation

Helpful Hint: It may be necessary to fasten a weight to the end of the main cable to maintain tension while connecting the drop lines, etc.

Assembling and Hanging the Water Line

Raise the suspension to a convenient working height.

A nail apron may be used to carry hangers, connectors, expansion joints, keys, adjustment levelers, or cord adjusters.

Figure 9 identifies several of the primary components used with the nipple watering line.

Suspend Water Lines

Suspend the watering line every 8' or 10' [2.4 or 3 m] at the suspension drops.

1. Route the suspension cable through the top hole of the suspension hanger and around the cable adjuster as shown in **"Figure 8."** on page 12.
2. Assemble the suspension hanger over the support channel at every suspension drop.

Figure 9. Nipple Waterer Components

Install Coupling Assembly

Install coupling liner assembly on the end of the water pipe, as shown in **Figure 10**. Insert the pipe until it contacts the stop rib inside the coupling liner assembly.

Note: It may be necessary to lubricate the inside of the coupling with soapy water to allow for easy installation.

Insert the next pipe into the other end of the coupling liner assembly until the support channels meet.

Figure 10. Coupling Liner Assembly Installation

Make sure the water pipes are fully inserted into the coupling assembly.

Note: The support channels will be butted against each other when the coupling is properly installed.

Insert the key into the first support channel, as shown in **Figure 11**. Insert the tab of the key through the hole in the second support channel. Once installed, bend the tab to secure it in place. This will prevent the water lines from separating at the joints.

Note: When an anti-roost system is to be installed it is recommended to use the channel bracket in place of the key.

Figure 11. Securing the Water Line together

Mid-Line Stand Tube

One mid-line stand tube is required for every 150' [46 m] of nipple watering line, see **Figure 12**.

1. Insert the water pipe into the body.
2. The support channel should slide into the channels on the top of the body.
3. Secure the body to the support channel using the supplied 10-24 stainless steel screw and lock nut.
4. Apply a small amount of PVC cement to the inside of the clear tubing and to the outside of the vent tube.
5. Push the stand tube assembly on the mid-line air remover or slope compensator vent tube.
6. Make sure the assembly is in the desired position when glueing.

Figure 12. Mid Line Stand Tube Installation

Optional Mid-Line Shut-Off Valve:

The mid-line shut-off valve may be located at any convenient location along the water line, except next to a joint.

1. Determine the desired location for the mid-line shut-off valve.
2. Use a flat screw driver to carefully pry 3 or 4 saddles away from the support channel. This will allow easy access to the water pipe for cutting.
3. Use PVC pipe cutters to cut a section out of the water pipe. See **Figure 13**. The shut-off valve may be used as a template to determine the required size of the cut.
4. Apply PVC cement to the couplers on the mid-line shut-off valve assembly.
5. Install the mid-line shut-off valve on the water line.
6. Reinstall the saddles previously loosened in the support channel.

Note: Chore-Time recommends installing a mid-line stand tube at the first joint before a mid-line shut-off valve to insure proper air removal from the water line.

Figure 13. Mid-Line Shut-Off Valve Installation

Optional Slope Compensator:

The slope compensator is used in houses that have a gradual slope over the length of the system. The slope compensator allows the water pressure to be re-adjusted along the line.

- The inlet end of the slope compensator must be at the top of the slope. Arrow must point in direction of water flow. Do not attempt to push water uphill.
- The maximum amount of drop between the inlet assembly and the slope compensator, or between two slope compensators, or between the slope compensator and the outlet assembly is 4 inches [100 mm]. See **Figure 14**.
- The maximum number of slope compensators used on any one water line is six.
- The maximum amount of slope over any water line is 28 inches [71 cm] of drop. See **Figure 14**.

Figure 14. Slope Compensator Assembly Installation

Outlet Assembly

The outlet end must be located within 6" [152 mm] of a suspension drop line. This may require adding an additional suspension drop line or cutting the last section of water line to stop within 6" [152 mm] of an existing drop line.

Install the outlet assembly, as shown in **Figure 15**.

1. Make sure the end of the water pipe is flush with the end of the support channel.
2. Make sure the hanger is properly oriented on the outlet assembly tee prior to securing the water line with PVC cement.
3. Secure the hanger to the support channel, as shown in **Figure 15**. If the water line was shortened to terminate under a suspension drop line, it may be necessary to drill a hole in the support channel for the 10-24 stainless truss head screw and lock nut. The hanger may be used as a template to determine proper hole location.
4. Wrap threads of the 1/2" male adapter on stand tube assembly with sealant tape.
5. Thread the stand tube assembly into the outlet tee. Turn the stand tube to the desired position.

Figure 15. Outlet Assembly Installation

Regulator Assembly

Assemble and install the regulator assembly, as shown in **Figure 16**.

1. Assemble the included hose thread adapter fitting to the inlet.
2. Slide the outlet end over the watering pipe (**it helps to wet the black outlet liner**) and into the end of the channel.
3. Slide the regulator bracket into the hole provided in the regulator and fasten into the hole provided in the channel with the included #10-24 x 5/8" hex washer head screw and #10-24 hex nut.
4. Assemble the stand tube and clamp to the stand tube outlet by sliding the tube over the o-ring and tightening the hose clamp.

Figure 16. Regulator End Components

Regulator Operation Modes

The CHORE-TIME® Water Regulator has three (3) selectable modes for operating the watering regulator (OFF, REGULATE, and FLUSH). The modes are selected by using the individual REGULATE and FLUSH control knobs, see figure 17.

1. Rotate the control knob to free the latch
2. Pull up on the control knob.

Control knobs: UP position is ON and DOWN position is OFF.

Figure 17. Mode Settings

3. Always lock control knob into position by rotating knob into the shown positions,

Regulator Guidelines

- PDS regulators are to operate in the REGULATE mode.
- Flushing does not require turning off the regulate control knob.
- Optimum incoming pressure is 30 to 35 psi [207 to 241 kPa].**
- When flushing, make sure the outlet line is clear of restrictions. Excessive back pressure can damage the Regulator.
- When using the Manual Adjustment version of the regulator, the water column is set by turning the manual adjustment knob on the bottom of the regulator in the direction shown on the regulator.

Figure 18. Control Knob Locked Position

Important: When increasing the water column, as soon as resistance is noticed, stop turning the manual adjustment knob or damage will occur.

Filter Control Panel Installation

The filter control panel is used to remove foreign material from the incoming water, and, if necessary, add medication to the water.

The step down regulator and gauge assembly is used to reduce the water pressure supplying the filter control panel. adjust the operating pressure as recommended in the Nipple Waterer Quick Reference Sheet. **See page 36.**

The filter control panel and step down regulator should be installed in a convenient location where incoming and outgoing water supply lines can be easily run. The control panel must be out of the reach of birds.

The filter control panel is shipped secured to a mounting board. The mounting board and filter control panel should be secured to wall or post using lag bolts (not supplied).

The step down regulator and gauge assembly is shipped un-assembled. Assemble the step down regulator and gauge assembly components as specified in the instruction (MW1052) shipped with the kit.

Connect the step down regulator and gauge assembly to the filter control panel, as shown in **Figure 4.**

Figure 4. Control Panel Installation

Flushable Filter Control Panel Installation

(Optional alternative to the standard filter control panel)

The flushable filter control panel is used to remove foreign material from the incoming water, and, if necessary, add medication to the water. This control panel features a filter that may be removed, cleaned, then reinstalled.

Two versions of the filter control panel are available.

The low pressure version is designed to accommodate gravity flow systems with 5 - 10 p.s.i. [34.5 - 69.0 kPa]. Do not exceed 15 p.s.i. [103.4 kPa] with this control panel, or damage will occur to the gauges.

Systems with 11+ p.s.i. [75.8+ kPa] should use the high pressure control panel and a step down regulator (order separately).

The filter control panel should be installed in a convenient location where incoming and outgoing water supply lines can be easily run. The control panel must be out of the reach of birds.

The filter control panel is shipped secured to a mounting board. The mounting board and filter control panel should be secured to wall or post using lag bolts (not supplied).

The gauge assembly is shipped un-assembled. Assemble the gauge assembly components as specified in the instruction (MW1052) shipped with the kit.

Low Pressure Control Panel
Part Number 36802-1
(5-10 p.s.i. [34.5 - 69.0 kPa])

High Pressure Control Panel
Part Number 36802-2
(11+ p.s.i. [75.8+ kPa])

Anti-Roost Installation

Pullet and breeder applications require the anti-roost system to be installed. This prevents the birds from setting on the water line. **Figure 5** shows an overview of the anti-roost system.

Figure 5. Anti-Roost System Overview

1. Make certain that an anchor plate with adjustment leveler is installed at the beginning and end of each anti-roost line. See **Figure 6**.
2. When an anti-roost system is to be installed the 46209-40 channel bracket kit must be used in place of the key to connect the channels together.
3. Install a hanger every 24" [610 mm]
4. Beginning at the first hanger, thread the training cable the full length of the anti-roost line. Allow approximately 24" [610 mm] extra and cut the cable.
5. Create a small loop with the cable and a cable clamp.
6. Connect the cable loop to the adjustment leveler/anchor plate.
7. Install a spring on the adjustment leveler/anchor plate near the inlet assembly.
8. Pull the cable taught and create a small loop with the cable and a cable clamp.
9. Connect the cable to the spring.
10. The spring should be stretched to an overall length of approximately 8" [203 mm]. Adjust as required.
11. Repeat the above procedure on each of the anti-roost lines.
12. Secure the poultry trainer to a wall or post near the water line.
Chore-Time recommends wiring the poultry trainer into separate electrical circuit that can be switched at the door.
Refer to the instructions supplied with the poultry trainer for wiring information.
Note: Make sure that the support channel is attached to ground (to insure proper operation of the poultry trainer). See **Figure 6**.
It will be necessary to install a jumper wire at stand tube, inlet assemblies, etc., to insure the ground circuit. See **Figure 19**.

Figure 6. Anti-Roost Components

Installing the Flush System

The flush system provides convenient one-man system purging.

Chore-Time recommends flushing one line at a time to maximize the cleaning in each line.

The hose, PVC pipe and connections must be purchased locally.

Install the flush components as shown in **Figure 13**.

1. Notice that the exit line must exit through the building wall at a minimum height of 72" [182.8 cm] above floor level.

Figure 13. Flush System Component Layout Diagram

2. The exit line needs to be 1" [2.5 cm] minimum for 1 flushing line. To connect multiple flushing lines together (as shown) the exit line needs to be 1 1/2" [3.8 cm] minimum for 2 flushing lines.
3. The exit line should be attached to the ceiling of the house and must exit out the side wall of the house. This line needs to be at an adequate height to allow clearance for any equipment used in the house. It may be necessary to route the exit line out both sides of the house to ensure water leaves the exit line.
4. Measure and cut the plumbing to the required lengths for your individual system.
5. The hose attached to the end of the watering line that extends up to the exit line is to be made of a flexible material.

Note: A siphon will be created during flush if the PVC pipe outlet is at or below the level of the top of the stand tube in the house at grow-out.

If it is not possible to have the pipe outlet above the top of the stand tube a vent must be installed. The vent must be above the top of the stand tube at all times during operation of the watering system.

Parts Listing

Filter Control Panel with Step Regulator

1186-40 7/99

Item	Description	Part No.
1*	3/4" PVC Street Ell	30138
2*	3/4" Threaded PVC Nipple	7531-1
3*	3/4" PVC Tee	7538
4*	3/4 x 1/4 Reducer Bushing	7789
5*	High Press. Water Gauge	7191
6*	Regulator	29951
7**	3/4" PVC Male Adapter	34100
8*	Union	8137
9**	Filter Inlet Assembly	8141
10**	10 Micron Filter Cartridge (Optional)	13145
	20 Micron Filter Cartridge (Standard)	7723
11**	High Press. Water Gauge	7191
12**	Filter Mounting Bracket	35302
13**	Mounting Board	35303
14**	Filter Outlet Assembly	35304
15**	3/4" Quarter Turn Valve	36720
16**	Medicator Outlet Assembly	35305
17**	Standoff Block	35300
18**	Plastic Conduit Clamp	35301
19**	3/4" Nylon Adapter	7543
20**	Medicator Connector Brace	35307
21**	Water Filter	35309
22	O-Ring	9191

*These components may be ordered as an assembly under Part No. 35308.

**These components may be ordered as an assembly under Part No. 9275.

Flush able Filter Control Panel

Low Pressure: 36802-1

High Pressure: 36802-2

1186-41 6/99

		36802-1	36802-2
Item	Description	Part No	Part No
1	Mounting Board	35303	35303
2	Meditator Outlet Assembly	36805	36805
3	3/4" Valve	36720	36720
4	3/4" Cross	7536	7536
5	Filter Inlet Assembly	36810	36810
6	Pressure Gauge	27722	7191
7	3/4" x 1/4" Reducer Bushing	7789	7789
8	Standoff Block	35300	35300
9	3/4" Plastic Conduit Clamp	35301	35301
10	3/4" PVC Male Adapter	9229	9229
11*	Step Regulator	29951	---
12*	Union	8137	---

		36802-1	36802-2

Miscellaneous Kits and Components

Miscellaneous Hose Components

Description	Part No.
Female 3/4" Hose Coupling Kit	7812
3/4" NPT x 3/8" Hose Barb	37141
3/8" Nylon Hose Clamp	37144
3/4" Female Swivel Fitting	50401
Hose Clamp	7187
3/4" ID Rubber Hose	*47820-0

*47820-0 is available in lengths of 50', 100', 150' and 200'.

The numbers following the dash represent the length of hose (47820-50 is 50' of hose).

Mid Line Shut-Off Kit: 29658

Item	Description	Part No
1	3/4" Quarter Turn Valve	29623

	Screw Hook (Large)	2041
6	1/8" Cable	27975
7	1/8" Cable Clamp	14898
8	3/32" Drop Cable	4937
9*	Winch Bracket with Hardware	1193
10	Pulley	44596
11	Split Drum Winch	29428
12	Handle Shank	2885
13**	Hand Winch	1212
14	Drill Adapter Shaft	2886
15	Winch Handle Pin	3761
16***	Open 1/8" Cable Eyelet (Package of 100 pcs)	44598-100
17	Crimping Tool	44599
--	1/8" Rope	9247

*Winch bracket to be used with hand winch only.

**Hand winch is recommended for systems up to 150 ft [46 m] only.

CHORE-TIME Nipple Watering Quick Reference Sheet

Note: The floor conditions are a good indication of adequate or deficient water supply. If the floors are wet the water column may be to high, if the floors are dry the water column may be to low. These are general guidelines, your particular environment may require different adjustments.

1 - 3 Days

At 1 - 3 Days, set the Nipple Height as shown below, The Water Column should be set at 2" - 4" (50mm - 100mm) as shown at the right.

3 - 21 Days

At 3 - 21 Days, set the Nipple Height as shown below, The Water Column should be set at 4" - 8" (102mm - 203mm) as shown at the right.

21 Days - Grow-Out

At 21 Days to Grow-Out set the Nipple Height as shown below, The Water Column should be set at 8" - 22" (200mm - 560mm) as shown at the right.

Operational Guidelines

Topic	Recommendations
Initial start-up procedure	<ol style="list-style-type: none"> 1. Thoroughly flush the water lines. 2. Set incoming water pressure to 35 p.s.i. [172 kPa] at the step regulator on the filter control panel. 3. Level the shavings under the water line to eliminate high/low spots. 4. Adjust the inlet regulators on the lines so the stand tube float corresponds to the drawing on page 36. Make sure there is water at the outlet sight tube and air is bled from the line. Indicator ball should be visible during operation. 5. Check outlet assemblies and stand tubes to make sure water is passing throughout the system.
Bird placement procedure	Immediately before birds are housed, brush the nipples with a broom to form water droplets on the nipples
Operation during bird grow out	If wet floors begin to develop under the drinker lines, increase ventilation and add additional heat to dry the litter. The floor conditions are a good indication of adequate or deficient water supply. If the floors are wet, the water column may be too high. If the floors are dry, the water column may be set to low.
Maintenance between batches	<p>Flush each line at full pressure for 5 minutes to remove deposits and sediments.</p> <p>Check pressure drop across water filter - clean or replace if necessary.</p> <p>Check regulator, shut-off valves, stand tube(s), and coupling liner assemblies for proper operation.</p> <p>Adjust the cable levelers so that the water lines are level.</p> <p>Maintain house temperature above freezing or drain the lines thoroughly. Drain inlet regulator(s).</p>
Precautions	<p>Do not over chlorinate. The maximum concentration is 2.5 ppm (parts per million) for extended periods and 5 ppm for flushing only.</p> <p>If medication or other chemicals are added to the water, flush the lines immediately after use, then chlorinate, as specified. Allow at least 24 hours before adding additional chemicals (such as iodine, citric acid, etc.) or vitamins to the water.</p>

Troubleshooting Guidelines

Problem	Cause	Solution
Nipples are leaking	Internal parts improperly assembled.	Disassemble and reassemble parts correctly.
	Foreign material preventing proper valve operation.	Trigger nipple a few times to see if leak stops. If leak persists, disassemble valve, clean, and reassemble. Replace valve components and saddle if leaks persist.
Leaking above cap assembly	Cap not properly tightened.	Tighten cap on saddle.
	Damaged saddle.	Replace saddle, nipple may not need to be replaced.
Leaking between saddle and PVC pipe	Damaged saddle.	Replace saddle, nipple may not need to be replaced.
Leaking at coupler liner assembly	Damaged (flexible) coupler liner or PVC coupler.	Replace coupler liner and/or PVC coupler.
Leaking or damaged inlet assembly	Damaged component or improperly glued component.	Replace damaged or defective component(s). It may be necessary to order a union to reconnect the Inlet components.
Stand tube not working properly	Depending on water quality and management techniques, the stand tube may require more frequent cleaning.	<ol style="list-style-type: none"> 1. Remove hose cap on top of stand tube. 2. Use a brush (available through Chore-Time) to thoroughly clean the stand tube. 3. Clean and reassemble the components and check for proper water level.

Guide to Cleaning Water Lines

Important: Chore-Time strongly recommends a regular cleaning program to eliminate water line contaminants.

Standard Cleaning Procedure

1. Mix the cleaning solution as indicated below.
2. Fill watering system with solution.
3. Allow solution to remain in lines 1 to 3 hours.
4. Flush system with clean water using high pressure.
5. Check filters, valve, and nipples for clogging from debris.
6. Adjust regulator pressure to normal operating pressure.

Regular Maintenance

The watering system should be cleaned one day every two weeks during the production cycle using a proportioner and one of the following stock solutions. Set the proportioner at 1 oz. (30 ml.) stock solution to 128 oz. (3785 ml.) of water.

1. Vinegar stock solution = 64 fl. oz. (1893 ml.) white household vinegar + 64 fl. oz. (1893 ml.) water
2. Citric Acid stock solution = 1 pack (205 gm) citric acid + 128 fl. oz. (3785 ml.) water.

End of Grow Out Cleaning

A chlorine solution should run through the watering system, using a proportioner, at 1 fl. oz. (30 ml.) stock solution to 128 fl. oz. (3785 ml.) water. The solution should be administered during one of the last 3 days of the grow out. This cleans the whole system including the nipple drinkers and sterilizes the entire system for the next grow out cycle.

1. Chlorine stock solution = 1 fl. oz. (30 ml.) 5-1/4% bleach (or similar source of 5-1/4% sodium hypochlorite) + 128 fl. oz. (3785 ml.) water. This solution will yield about 2 PPM chlorine in the drinkers with average water. **Do not** exceed this level for an extended period of time (otherwise, damage to the system may occur).

After Administering Vitamins, Medication or other Chemicals

Chore-Time recommends flushing and chlorinating lines immediately after administering vitamins, medication or other chemicals. Failure to flush and chlorinate can result in bacteria build-up which can reduce or prevent water flow.

Between Flocks

The watering system should thoroughly cleaned between flocks. A stronger cleaning solutions may be used since birds will not be drinking the water. It is important to thoroughly flush the system (after 1 to 3 hours) with clean water to prevent storing high concentrates of cleaning solution in the watering system until the next flock is placed.

Use one of the following stock solutions for cleaning the system between flocks. Set the proportioner at 1 oz. of stock solution to 128 oz. (3785 ml.) water.

1. Vinegar stock solution = 128 fl. oz. (3785 ml.) white household vinegar.
2. Citric Acid stock solution = 4 pack (205 gm) citric acid + 128 fl. oz. (3785 ml.) water.

Water Quality

Hardness

Hardness is the calcium and magnesium content of a water supply. These minerals are responsible for scaling that forms in hot water heaters, plumbing lines, humidifiers, dishwashers and all other water using appliances. Water containing hardness minerals are generally classified as:

Soft Water	0 - 1.0 GPG
Slightly Hard Water	1.1 - 3.5 GPG
Moderately Hard Water	3.6 - 7.0 GPG
Hard Water	7.1 - 10.5 GPG
Very Hard Water	10.6 GPG or greater

Iron

Iron, when present in amounts of 0.3 ppm or higher, can cause a yellow or rusty appearance in water. It can also cause staining of clothing and water fixtures. Iron can be found in two forms, clear (dissolved) or red (oxidized) water iron. Water refiners are capable of removing both types of iron. Higher amounts of iron may require further treatment.

Iron Bacteria

Iron bacteria can be found in water supplies containing clear water iron. The bacteria use the clear water iron as a source of energy, and at the same time, convert the iron to the red water state. These bacteria are not considered a health hazard, but can plug plumbing lines, fixtures and appliances. These bacteria also promote localized corrosion and impart a taste and/or color to water. Effective treatment requires shock chlorination of all plumbing lines prior to the installation of any equipment. This is followed by the installation of a chemical feed pump feeding chlorine to eliminate the bacteria, and a clarifying filter to remove the residue.

Acid Water

The acid content of a water supply is measured and reported in terms of pH units. Acid water causes staining of plumbing fixtures and corrosion of plumbing systems, which may necessitate expensive repairs. Water with a pH of less than 6.8 is considered acidic. A pH of 6.0 to 6.7 indicates a moderately acidic supply and should be treated with a neutralizing filter. A pH of 4.0 to 5.9 is considered extremely acidic and should be treated with a chemical feed pump feeding neutralizing compound.

Aggressive/Corrosive Water

Aggressiveness of water is measured by the stability index (A calculation from several factors in a water supply). A stability index of 7.5 or higher indicates the water may be corrosive tendencies. This type of corrosion may attack plumbing and fixtures causing rusty or blue/green stains. The use of a phosphate crystal cartridge will help to eliminate this problem.

Taste and Odor

Objectionable tastes and/or odors can be dissolved minerals, gases, organic contamination, or from chlorination. Treatment requires the installation of taste and odor tank filter for the whole house or a taste and odor cartridge filter for individual faucets.

Hydrogen Sulfide

Hydrogen sulfide is a dissolved gas common in some water supplies. It is detected by a rotten egg taste and/or odor of the water. Proper treatment requires the installation of a chemical feed pump system feeding household chlorine bleach, followed by a sediment filter to remove the precipitation.

Sand, Silt or Sediment

Sand, silt or sediments are found in many water supplies. It is usually detected by a cloudy or hazy appearance when the water is first drawn. Treatment requires the installation of a sediment filter to remove the particles.

MADE TO WORK.
